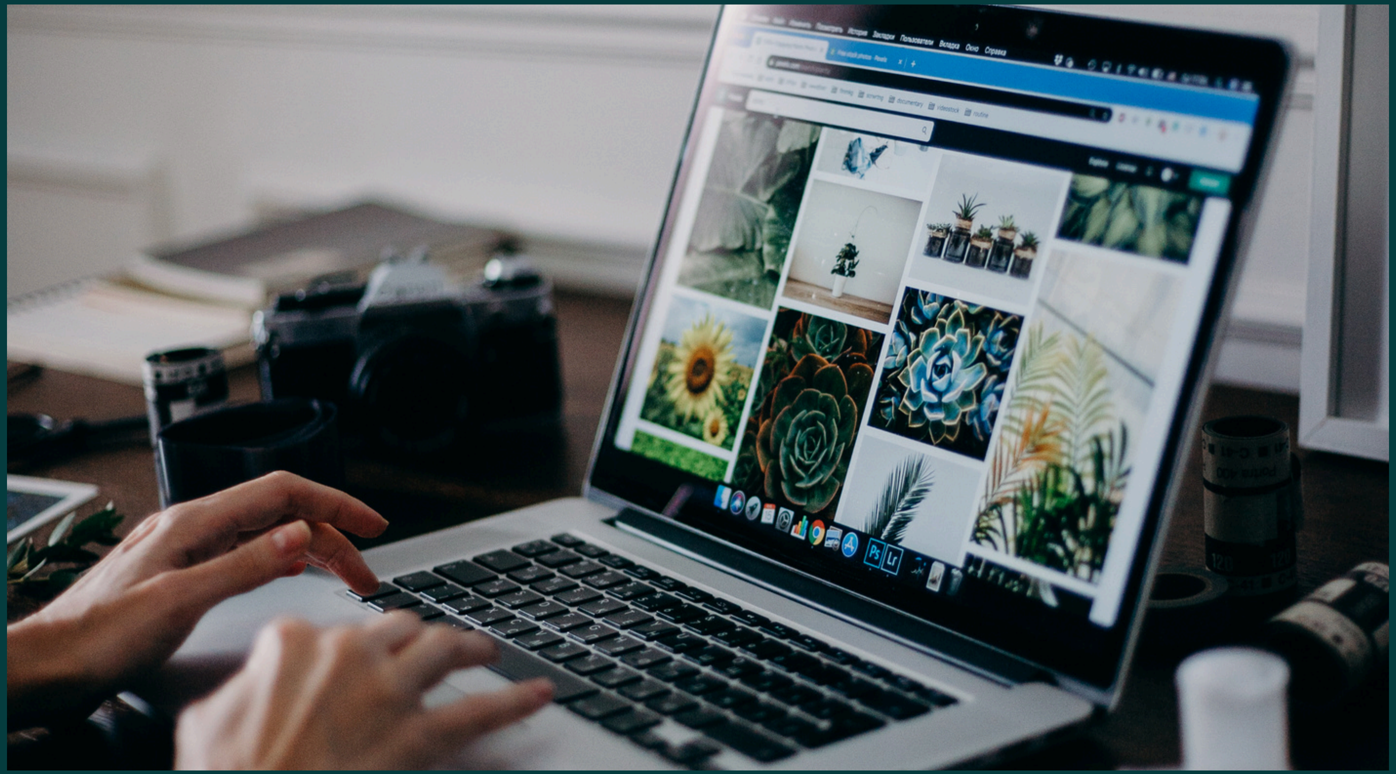
SMART TASKER

Smart Tasker – A Task Management System

Problem Statement:
Managing daily tasks manually is inefficient and often leads to missed deadlines and poor organization.

Target Users:
Students, professionals, and anyone who wants to manage tasks efficiently.

SYSTEM DESIGN



System Architecture:
- Main Class: Handles user interaction (input/output)
- TaskManager Class: Handles business logic and operations
- Task Class: Represents task data

Package Structure:
- model → Contains Task class
- service → Contains TaskManager class

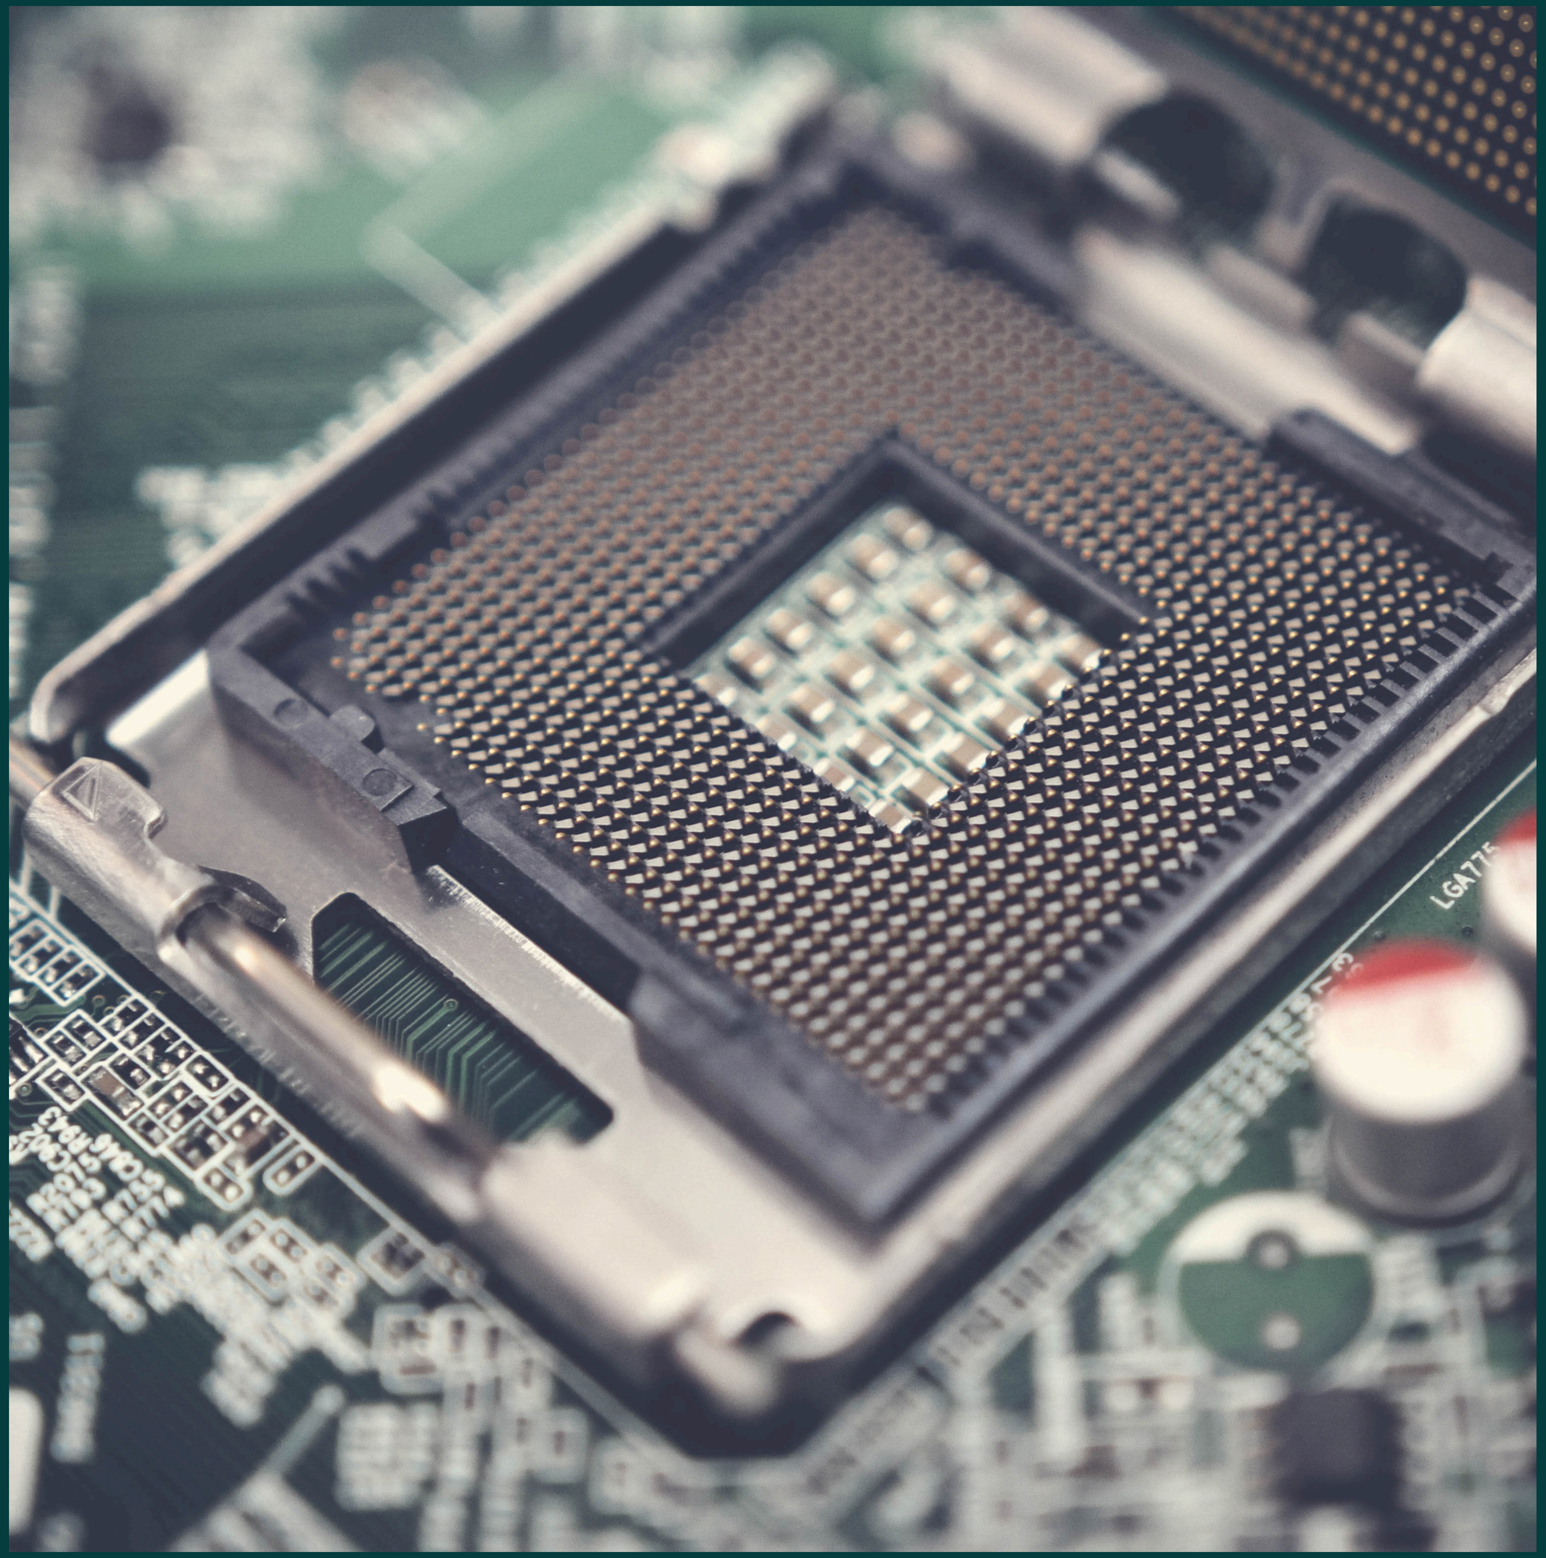
OOPS CONCEPTS

Encapsulation:
- Task attributes are private with public getters

Abstraction:
- TaskManager hides implementation details

Polymorphism:
- Method-based behavior (e.g., displayTasks)

Exception Handling:
- Prevents program crash due to invalid input



TECHNICAL HIGHLIGHT

Data Structure Used:
- ArrayList for dynamic task storage

File Handling:
- Save tasks to file
- Load tasks from file

Design Decisions:
- Modular class-based structure

Reason:
- Improves scalability, readability, and maintainability

LIVE DEMO

Features Demonstrated:
- Add a new task
- View all tasks
- Mark task as completed
- Delete a task

Error Handling:
- Handles invalid user input effectively
